Preface	1
Foreword	5
Introduction	7
Contributors	9
Main symbols and physical constants	13
Abbreviations	15
Main crystalline phases considered in this book ..	17

Chapter 1: The classical nucleation theory ...	19
1.1. From devitrification...	20
1.2. ... to the origins of CNT	21
1.3. Homogeneous nucleation	22
1.3.1. Thermodynamic considerations	22
1.3.2. Kinetic considerations	25
1.3.3. Nucleation rate	26
1.3.4. Examples of glasses with homogeneous nucleation	27
1.4. Heterogeneous nucleation	29
1.5. Induction time	31
1.6. Crystal growth	33
1.6.1. Crystal growth rate	33
1.6.2. Crystalline morphology	35
1.6.3. Constraints on crystals	38
1.6.4. Ostwald ripening	38
1.6.5. TTT diagram	39
1.7. CNT facing experiments	40

1.8. Ostwald's rule	41
1.9. Conclusion	42

Chapter 2: Beyond the classical nucleation theory

2.1. Cluster dynamics	43
2.2. Density functional theory (DFT)	45
2.3. Validity of the Stokes-Einstein equation?	47
2.4. Models of non-classical nucleus	47
2.4.1. Introduction of a fractal surface	48
2.4.2. Diffuse interface theory (DIT)	49
2.4.3. Experimental observations of the critical nucleus?	50
2.5. Non-homogeneous disordered system	51
2.5.1. Nucleation theory in systems with static local disorder.	51
2.5.2. Recent experimental observations.	53
2.6. Generalized Gibbs's approach	54
2.6.1. Simplified theoretical description	54
2.6.2. Implications for nucleation/growth	57
2.6.3. Experimental observations of metastable nucleation	60
2.7. Two-step model	62
2.7.1. Description of the two-step model	62
2.7.2. Experimental observations.	64
2.8. Conclusion	65

Chapter 3: Thermodynamics of the glassy and the crystalline states – General kinetics of return to equilibrium

3.1. Stability and instability: application to oxide glasses	68
3.1.1. Stability and postulates of thermodynamics	68
3.1.2. The stability condition – Back to equilibrium.	71
3.1.3. Application to the specific case of the spinodal decomposition (cf. also chapter 4).	73
3.1.4. Generalization	75
3.2. Experimental methods for the determination of thermodynamic quantities at the equilibrium of a stable or metastable oxide glass or crystal	77
3.2.1. Overview of thermodynamic measurable quantities.	77

3.2.2.	<i>Measurement of enthalpy increment, heat capacity and transition enthalpy</i>	81
3.2.3.	<i>Measurement of the formation or mixing functions.</i>	91
3.2.4.	<i>Measurement of free enthalpy and derivative quantities by Knudsen Effusion Mass Spectrometry (KEMS)</i>	98
3.2.5.	<i>Importance of coupling the methods</i>	101
3.3.	Parameters characterizing the metastable vitreous state	103
3.3.1.	<i>Thermodynamical description of the glass transition.</i>	103
3.3.2.	<i>The fictive temperature and its measurement</i>	106
3.3.3.	<i>Configurational entropy at 0 K and its measurement</i>	108
3.3.4.	<i>Kinetic approach of the glassy transition – order parameter</i>	109
3.4.	Phenomenological approach of recrystallisation kinetics – Return to equilibrium.	111
3.4.1.	<i>Transformation by nucleation and growth - constant rate</i>	115
3.4.2.	<i>Transformation by nucleation and growth – constant growth rate, time-dependent germination rate.</i>	118
3.4.3.	<i>General form of the kinetic equation</i>	119
3.4.4.	<i>In practice.</i>	120
3.5.	Conclusion	123

Chapter 4: Phase separation

processes in glass	125
4.1. Introduction	125
4.2. Thermodynamic description of phase separation	126
4.2.1. <i>Solubility in ideal solutions.</i>	126
4.2.2. <i>Immiscibility in regular solutions.</i>	127
4.2.3. <i>Description of immiscibility regions in glass.</i>	130
4.3. Kinetics of phase separation	136
4.3.1. <i>Effect of diffusion mode</i>	136
4.3.2. <i>Kinetics of phase separation by nucleation and growth</i>	137
4.3.3. <i>Spinodal decomposition: Approach adopted by Cahn and Hilliard.</i>	137
4.4. Influence of structure on the phase separation tendency of glass	140
4.4.1. <i>Structural models: binary silicate and borate systems</i>	140
4.4.2. <i>Effect of the addition of elements on phase separation</i>	144
4.4.3. <i>Structural characterisation tools</i>	146
4.5. Characterisation of phase separation	146
4.5.1. <i>Metastable phase separation</i>	146

4.5.2.	<i>Stable phase separation extending into the metastable range.</i> . . .	148
4.5.3.	<i>Example of phase separation mode.</i>	150

Chapter 5: Solid-state chemistry approach of the main crystalline phases in glass-ceramics

5.1.	Introduction	155
5.2.	Silicate crystalline phases	156
5.2.1.	<i>General features.</i>	156
5.2.2.	<i>The six silicate families.</i>	158
5.2.3.	<i>Silica polymorphs.</i>	166
5.3.	Phosphates	171
5.3.1.	<i>Consequence of phosphorus pentavalency</i>	171
5.3.2.	<i>Phosphate families.</i>	171
5.3.3.	<i>Formation of non-phosphate crystals in phosphate based glass matrix</i>	178
5.4.	Other crystalline phases	179
5.5.	Conclusion	183

Chapter 6: Elaboration and control of glass-ceramic microstructures

6.1.	Interest of controlling glass-ceramic microstructure	185
6.2.	Controllable parameters	186
6.2.1.	<i>Parent glass composition.</i>	186
6.2.2.	<i>Nucleation/growth mechanism</i>	186
6.2.3.	<i>Thermal treatment.</i>	187
6.3.	Elaboration processes	188
6.3.1.	<i>Classic methods.</i>	188
6.3.2.	<i>New glass-ceramic elaboration processes.</i>	190
6.4.	Characterisation methods	191
6.5.	Microstructure types	192
6.5.1.	<i>Spheroid microstructures.</i>	192
6.5.2.	<i>Needle-like microstructures.</i>	195
6.6.	Designing glass-ceramics with desired properties by controlling the crystallisation process	198
6.6.1.	<i>Volume nucleation.</i>	198

6.6.2.	<i>Surface nucleation</i>	200
6.6.3.	<i>Double nucleation</i>	200
6.7.	Perspectives	200

Chapter 7: X-ray diffraction and glass-ceramic materials	201
7.1. Reminder	202
7.1.1. <i>X-ray/matter interactions</i>	202
7.1.2. <i>Scattering by a single atom</i>	203
7.1.3. <i>The Bragg law</i>	206
7.1.4. <i>Reciprocal space and diffraction</i>	207
7.1.5. <i>Diffracted intensity and correction terms</i>	208
7.1.6. <i>Bragg peak profiles</i>	212
7.2. Sample preparation and acquisition geometry	218
7.2.1. <i>Sample preparation</i>	218
7.2.2. <i>Acquisition geometry</i>	219
7.3. Quantitative analysis	219
7.3.1. <i>Samples with low absorption contrast</i>	220
7.3.2. <i>Samples with intermediate absorption contrast</i>	220
7.3.3. <i>Quantification for an “amorphous” phase-containing compound</i>	221
7.3.4. <i>Example of phase quantification in a nuclear glass</i>	223
7.4. Beyond conventional XRD analysis	225
7.5. Conclusion	227

Chapter 8: Glass and crystallisation: mechanical properties	229
8.1. Effective elastic properties of glass-ceramics	229
8.2. Hardness of glass-ceramics	232
8.3. Strength and toughness of glass-ceramics	233
8.3.1. <i>Theoretical and experimental considerations</i>	233
8.3.2. <i>Role of the microstructure</i>	237
8.4. Residual stresses and cracking	239
8.4.1. <i>Modelling residual stresses</i>	239
8.4.2. <i>Residual stresses and microcracking</i>	241
8.4.3. <i>Residual stress measurements</i>	244

8.5. Anisotropy	246
8.6. Conclusion	247

Chapter 9: Electron microscopy applied to the study of nucleation and crystallisation in glasses

9.1. Scanning Electron Microscopy	249
9.2. Transmission Electron Microscopy	250
9.2.1. Principle	250
9.2.2. TEM imaging techniques	253
9.2.3. STEM-HAADF	258
9.2.4. EELS	259
9.2.5. Chemical imaging: Energy Filtered TEM - EFTEM	262
9.2.6. Aberration correction in HRTEM and STEM	263
9.2.7. Sample preparation	263
9.3. Nucleation/growth	264
9.3.1. Observation and nature of initial crystals	264
9.3.2. Mechanisms of nucleation and role of nucleating agents	265
9.3.3. Secondary crystallisation	266
9.4. Heterogeneities and phase separation	268
9.5. Conclusion	269

Chapter 10: X-ray and neutron small-angle scattering

10.1. Introduction	271
10.2. X-ray and neutron scattering: Specificities and complementarities	271
10.3. Distances and phenomena	272
10.3.1. Thermal density fluctuations	272
10.3.2. Chemical concentration fluctuations	273
10.3.3. Supercritical fluctuations	273
10.4. Basic notions for small-angle scattering	273
10.5. Data analysis	273
10.6. Examples of applications	278
10.6.1. Detailed example of a liquid-liquid phase separation in a glass containing molybdenum	278
10.6.2. Other examples of study of phase separation	281

10.6.3.	<i>Nucleation study by SANS and SAXS.</i>	283
10.6.4.	<i>Example of nucleation and crystallisation in a glass by SANS.</i>	283
10.6.5.	<i>Example of nucleation and crystallisation in a cordierite glass by SAXS.</i>	284
10.7.	Conclusion	285

Chapter 11: Nuclear Magnetic Resonance: deciphering disorder and crystallisation phenomena in glassy materials	291
11.1. Introduction	291
11.2. Basic principles of NMR.	294
11.2.1. <i>NMR interactions: a fingerprint of the local environment</i>	294
11.2.2. <i>The solid-state NMR toolkit.</i>	295
11.3. Spectral signature of disorder in NMR and its resolution	299
11.3.1. <i>NMR of disordered systems</i>	300
11.3.2. <i>Combining NMR with atomistic modelling</i>	303
11.4. Application to crystallisation studies.	305
11.5. Conclusion	312

Chapter 12: Raman spectroscopy: a valuable tool to improve our understanding of nucleation and growth mechanism	319
12.1. Introduction	319
12.2. Principle of Raman spectrometry	320
12.3. Instrumentation and Analysis	322
12.3.1. <i>HOLOLAB 5000 spectrometer.</i>	322
12.3.2. <i>T64000 spectrometer and the confocal system.</i>	323
12.3.3. <i>Sampling volume.</i>	324
12.3.4. <i>Raman spectra intensity.</i>	325
12.3.5. <i>Black body emission and limitation to performing in situ measurements at high temperature</i>	325
12.3.6. <i>Correction of the temperature effect and excitation wavelength</i>	327
12.4. Various experimental studies	327
12.4.1. <i>Nucleation and phase identification in the CaO-Al₂O₃-SiO₂ system</i>	328
12.4.2. <i>Ex situ measurements of silicate apatite crystallisation in a borosilicate matrix</i>	330

12.4.3.	<i>In situ study of silico apatite crystallisation in a borosilicate matrix</i>	335
12.4.4.	<i>Induced crystallisation by laser impact in GeO₂ glass</i>	335
12.4.5.	<i>Molybdenum demixion in a borosilicate glass.</i>	337
12.5.	Advantages and disadvantages	339

Chapter 13: *In situ* crystallisation investigations using large scale facilities 345

13.1.	X-ray absorption spectroscopy	345
13.1.1.	<i>Principles</i>	345
13.1.2.	<i>Applications and results</i>	346
13.2.	X-ray and neutron scattering	349
13.3.	Non-conventional furnaces on high facilities	352
13.3.1.	<i>Aerodynamic levitation.</i>	352
13.3.2.	<i>Micro heating device</i>	354
13.4.	Conclusion	355

Chapter 14: Commercial applications of glass-ceramics 361

14.1.	Introduction	361
14.2.	Microstructure and formation of glass-ceramics.	361
14.2.1.	<i>Microstructure.</i>	361
14.2.2.	<i>Glass-ceramic formation by crystal nucleation and growth.</i>	362
14.3.	Glass-ceramic properties	365
14.4.	Applications	367
14.4.1.	<i>Transparent low-expansion glass-ceramics.</i>	367
14.4.2.	<i>Other transparent glass-ceramics</i>	370
14.4.3.	<i>Machinable glass-ceramics</i>	370
14.5.	Conclusion	373

Chapter 15: Glass and glass-ceramic biomaterials 375

15.1.	Introduction	375
15.2.	Dental applications.	376
15.2.1.	<i>Materials for structures.</i>	376

15.2.2.	<i>Materials for aesthetics (cosmetics)</i>	378
15.2.3.	<i>Bone reconstruction</i>	379
15.2.4.	<i>Bioactive coatings</i>	379
15.3.	Orthopaedic applications	380
15.3.1.	<i>Monolithic glasses and glass-ceramics</i>	380
15.3.2.	<i>Polymer-matrix composites</i>	383
15.4.	Biocidal glasses and glass-ceramics	385
15.5.	Conclusion	385

Chapter 16: Colouring by metallic nanoparticles	387
16.1. Introduction	387
16.2. Surface plasmons in metal colloids.	388
16.3. Gold ruby glass and copper red glazes	392
16.3.1. <i>Gold ruby glass</i>	392
16.3.2. <i>Copper red glazes</i>	393
16.4. Luster ceramics.	396
16.5. Conclusion	400

Chapter 17: Transparent glass-ceramics	407
17.1. Interest of transparent glass-ceramics.	407
17.2. Transparency in glass-ceramics	408
17.2.1. <i>General principle</i>	408
17.2.2. <i>Light scattering in transparent glass-ceramics</i>	408
17.2.3. <i>Transparent glass-ceramic synthesis</i>	410
17.2.4. <i>Opalescence: a particular case</i>	411
17.3. Properties and applications	412
17.3.1. <i>Transparent glass-ceramics based on oxide compositions</i>	413
17.3.2. <i>Transparent glass-ceramics based on fluoride/oxyfluoride compositions</i>	417
17.3.3. <i>Transparent glass-ceramics based on chalcogenides</i>	419
17.4. Perspectives	420

Chapter 18: Luminescence properties of rare earth ions doped in insulating nanoparticles embedded in glassy hosts	423
18.1. Introduction	423
18.2. Optical properties of rare earth ions in bulk materials	425
18.2.1. <i>Energy level structure</i>	425
18.2.2. <i>Transition intensities</i>	426
18.2.3. <i>Homogeneous and inhomogeneous broadening of transitions</i>	427
18.2.4. <i>Radiative and non-radiative lifetimes</i>	428
18.2.5. <i>Energy transfers</i>	429
18.3. Luminescence of rare earth ion doped nanoparticles	429
18.3.1. <i>Phonon spectrum modification</i>	429
18.3.2. <i>Structural effects</i>	431
18.3.3. <i>Surface effects</i>	432
18.3.4. <i>Quantum confinement</i>	433
18.4. RE doped nanoparticles luminescence and influence of the host matrix	433
18.4.1. <i>Dependence of the radiative lifetime on the refractive index of the surrounding host</i>	434
18.4.2. <i>Two-level system</i>	436
18.4.3. <i>Interaction with “phonons” of the glassy environment</i>	437
18.5. Conclusion	438

Chapter 19: Glass-ceramics for engineering optical properties and nonlinear optics for engineering glass ceramics	441
19.1. Introduction	441
19.2. Units and nonlinear optical phenomena	442
19.2.1. <i>Second order nonlinearity</i>	442
19.2.2. <i>Third order nonlinearity</i>	443
19.3. Glass ceramic for nonlinear optics	444
19.3.1. <i>Second order nonlinearity and second harmonic generation</i>	444
19.3.2. <i>Third order nonlinearity and saturable absorption</i>	448
19.4. Laser induced phase separation and crystallisation	449
19.4.1. <i>Laser-assisted crystallisation and second order nonlinearity</i>	450
19.4.2. <i>Nonlinear optics and fabrication of glass ceramics</i>	451
19.5. Conclusion	457

Chapter 20: Oxyfluoride glass-ceramics	459
20.1. Introduction	459
20.2. Synthesis of oxyfluoride glass-ceramics.	460
20.3. Genesis, size and morphologies of fluoride particles inside a glassy matrix	461
20.4. Crystallinity and size of the fluoride particles as function of the duration of the thermal treatment	466
20.5. Constraints induced by the glassy matrix and lattice parameters of the crystallized phase	468
20.6. Optical properties	469
20.7. Conclusion and future prospects	470

Chapter 21: Nucleation, crystallisation and phase separation in chalcogenide glasses	473
21.1. Introduction	473
21.2. Chalcogenide glass-ceramics for infrared optics.	474
21.2.1. Chalcogenide glass-ceramics for non-linear optics	475
21.2.2. Chalcogenide glass-ceramics with improved mechanical properties	476
21.2.3. Increase of up-conversion luminescence.	478
21.3. Phase change tellurides: outstanding materials for information storage	480
21.4. Ion conductive chalcogenide glasses: effects of phase separation and partial crystallisation on electrical properties	483
21.4.1. Chalcogenide glass-ceramics for electrochemical energy storage . .	483
21.4.2. Photosensitive chalcogenide glasses, potential resins for submicronic resolution lithography	485
21.4.3. Chalcogenide glasses: promising materials for the development of ionic memories	486
21.5. Conclusion	488

Chapter 22: Glass-ceramics for waste immobilization	491
22.1. Introduction	491
22.2. Glass-ceramics for the immobilization of highly radioactive wastes	494
22.2.1. Nature and origin of highly radioactive wastes. Aims of containment	494

22.2.2.	<i>Glass-ceramic matrices to immobilize non-separated wastes.</i>	496
22.2.3.	<i>Glass-ceramics to immobilize separated long-life wastes</i>	509
22.3.	Glass-ceramics for the immobilization of toxic or hazardous non-radioactive wastes	516
22.3.1.	<i>Toxic or hazardous non-radioactive wastes: various origins and compositions.</i>	516
22.3.2.	<i>Vitrification and glass-ceramization of non-radioactive wastes.</i>	518
22.4.	Conclusion	525

Chapter 23: Crystalline glazes	527
23.1. From traditional ceramics to glaze formulation	527
23.2. The discovery of the role of zinc in crystalline glazes	529
23.3. Other crystal-glaze compositions: matte glazes	536
23.4. Other examples of controlled crystallisations	537
23.5. Conclusion	538
